Definition: A vector image is one of the two major graphic types (the other being bitmap). Vector graphics are made up of many individual objects. Each of
these objects can be defined by mathematical statements and has individual properties assigned to it such as color, fill, and outline. Vector graphics are
resolution independent because they can be output to the highest quality at any scale.

Software used to create vector graphics is sometimes referred to as object-based editing software. Common vector formats include AI (Adobe Illustrator),
CDR (CorelDRAW), CGM (Computer Graphics Metafile), SWF (Shockwave Flash), and DXF (AutoCAD and other CAD software). Vector graphics tend to have
much smaller file sizes than raster-based bitmaps.

If you have the Flash plug-in installed on your computer, you can right click on the image below to zoom in. When you zoom in on the image, notice that the
edges of the text are always crisp and sharp at any scale. This is why vector images are called resolution independent. Currently, the only way vector images can be displayed on
the Web is by requiring viewers to install a browser plug-in.

Detail Description Paragraph - DETX (2):
    [0041] FIGS. 1a and 2a show a web page 10 written using
HTML in known
manner.  Independently, an animated advertisement 11 is
embedded within a
separate web page layer 12 using known DHTML technology.
The animation itself
is likewise accomplished using off-the-shelf vector graphic
tools and is not
per se a feature of the invention.  In a preferred
embodiment reduced to
practice, the animation was prepared using Flash, this
being a proprietary
vector graphics program produced and distributed by
Macromedia Inc.  Details
and virtual examples can be seen in their website
http://www.flash.com/.  Flash
is a registered trademark of Macromedia Inc.
